

AXRAH — Instagram Carousel

FDA PBM Authorization · Clinical Credibility Campaign

Date: June 18, 2026 · Format: 7-slide Instagram Carousel · Audience: B2B Clinics · Version: v2

Instagram Carousel — FDA PBM Authorization (v2)

Date: 2026-06-18

Angle: FDA validation as proof of what AXRAH was already built on

Goal: Clinical credibility / B2B clinics — AXRAH threaded throughout, not tacked on at the end

Rating target: 9/10

SLIDE 1 — HOOK (COVER)

Headline:

The FDA just validated what AXRAH is built on.

Subhead:

Photobiomodulation is now FDA-authorized medicine.

Visual direction: AXRAH Pod Ultra, lit up, center frame. Red and near-infrared glow. Clean dark background. AXRAH wordmark top left, subtle. No stock imagery.

Image prompt:

A sleek, futuristic full-body red light therapy pod photographed in a dark clinical studio. The interior glows with deep red and near-infrared light (660nm red, 850nm NIR). The pod is open, inviting. Hard shadows. High contrast. No people. The mood is precision medical technology, not spa wellness. Shot as if for an Apple product launch page. Ultra-sharp. Cinematic lighting.

SLIDE 2 — THE NEWS

Headline:

20 million Americans have dry AMD.

Subhead:

Until this week: no non-invasive treatment existed.

Body:

The FDA just changed that — authorizing photobiomodulation as the first non-invasive treatment for geographic atrophy (dry AMD).

The same technology. The same wavelengths. The same mechanism AXRAH has been delivering to clinics since day one.

Visual direction: Large "20,000,000" numeral dominating the slide. Clinical white and red palette. AXRAH logo watermark.

Image prompt:

A stark, high-contrast typographic composition on a near-black background. The number "20,000,000" fills most of the frame in a clean sans-serif font, rendered in a gradient from deep red to near-infrared purple. Below it in small white text: "Americans with dry AMD. No non-invasive treatment — until now." Minimal. Medical. No human faces or stock photography.

SLIDE 3 — REFRAME

Headline:

This isn't alternative therapy anymore.

Body:

FDA authorization doesn't change what photobiomodulation does.

It changes what the medical establishment is willing to say about it.

Insurance providers. Hospital systems. Medical directors. They were waiting for this moment.

AXRAH wasn't waiting. We built clinical-grade PBM infrastructure before the stamp arrived.

Visual direction: Split frame. Left: dim, skeptical — "alternative therapy" in faded text. Right: bright, clinical — "FDA-authorized medicine" in crisp white. AXRAH logo anchors the bright side.

Image prompt:

A dramatic split-composition photograph. Left half: desaturated, slightly blurred image of a generic wellness space — soft lighting, candles, vague. The words "alternative therapy" overlaid in muted gray. Right half: sharp, high-contrast image of a clinical-grade light therapy device in a medical facility with clean lines and precise lighting. The words "FDA-authorized medicine" overlaid in bright white. A hard vertical line divides the two worlds. AXRAH wordmark in the bottom right corner.

SLIDE 4 — THE MECHANISM (AXRAH OWNS THIS)

Headline:

Here's why it works.

And why wavelength selection is everything.

Body:

Red and near-infrared light penetrate tissue and activate cytochrome c oxidase — the enzyme that drives ATP production in your mitochondria.

More ATP. Less inflammation. Faster repair.

AXRAH Pod Ultra delivers 5 specific wavelengths:

633 · 660 · 810 · 850 · 940nm

Not chosen for marketing. Chosen because the clinical literature says these are the frequencies that trigger the response.

Visual direction: Clean wavelength spectrum graphic — 5 vertical lines at the exact nanometer positions, labeled. Dark background. Clinical data feel. AXRAH branding integrated into the graphic.

Image prompt:

A scientific visualization of the electromagnetic spectrum zoomed into the visible-to-near-infrared range (600nm–1000nm). Five sharp vertical lines illuminate the spectrum at exactly 633nm, 660nm, 810nm, 850nm, and 940nm — each labeled in clean white type, each glowing in its corresponding color (red tones to invisible NIR shown as a soft purple-

white glow). Dark black background. The overall aesthetic is a scientific instrument readout — precise, clinical, authoritative. No icons, no illustrations. Data visualization only.

SLIDE 5 — MARKET SIGNAL

Headline:

Your patients are already researching this.

Body:

32% of US adults have tried or plan to try red light therapy.

They've listened to Huberman. They've seen what Bryan Johnson does daily. They know the protocol.

What they're looking for now is a clinic that takes it seriously.

That's the gap AXRAH fills.

Visual direction: "32%" huge, centered. Below it: three small avatar icons (podcast listener / biohacker / patient). Feels data-driven, not salesy.

Image prompt:

A bold data visualization poster on a dark charcoal background. The number "32%" is enormous, filling the top two-thirds of the frame, rendered in a glowing red-to-white gradient as if illuminated from within. Below it in clean white sans-serif: "of US adults have tried or plan to try red light therapy." In the bottom third, three abstract human silhouettes in red, representing patients already walking into clinics and asking about RLT. Minimal. Infographic-style. No stock photo faces.

SLIDE 6 — THE AXRAH SPEC (WHY CLINICAL-GRADE MATTERS)

Headline:

Not all red light therapy is the same.

Subhead:

And your patients will eventually know the difference.

Body:

AXRAH Pod Ultra

- 43,200 LEDs
- 5 wavelengths (633 / 660 / 810 / 850 / 940nm)
- 6,000W output
- 129 mW/cm² irradiance

Priced at approximately 1/3 of NovoTHOR and TheraLight.

Clinical-grade output. Without the clinical-grade price tag.

Visual direction: Spec sheet aesthetic. Monospaced font for the specs. Pod Ultra product image inset right. Clean, not flashy.

Image prompt:

A sleek product specification layout photographed as if printed on matte black paper, but rendered digitally. On the left: technical spec lines in a monospaced white font against deep black — "43,200 LEDs," "5 Wavelengths," "6,000W," "129 mW/cm²" — each line separated by fine red horizontal rules. On the right: a crisp, perfectly lit 3/4-view render of the AXRAH Pod Ultra, glowing subtly red from within. The overall composition resembles an Apple tech spec sheet crossed with a medical device data card. No gradients, no decorative elements.

SLIDE 7 — CTA

Headline:

The clinics that add this now own their market.

Body:

The FDA just gave every medical director cover to say yes.

The question is which clinic in your city gets there first.

AXRAH works with medical spas, PT practices, chiropractic offices, sports performance facilities, and hotels — to spec, install, and support full-body PBM at a fraction of what competitors charge.

Book a consultation. We'll build the ROI case with you.

CTA: → Link in bio

Visual direction: Full-width Pod Ultra in a luxury clinic setting. Warm but clinical. AXRAH wordmark center. CTA button overlaid clean.

Image prompt:

An architectural interior photograph of a high-end medical wellness clinic. The room has clean white walls, polished concrete floors, and recessed clinical lighting. In the center, an open full-body red light therapy pod glows with warm red and deep crimson light, casting a soft halo on the floor. The space feels like a premium medical facility, not a spa. No people in frame. Shot from a low angle looking slightly upward to give the pod an authoritative, imposing presence. The mood: this is serious medicine, and serious business. AXRAH wordmark superimposed in clean white at the bottom center.

CAPTION

Draft:

The FDA just authorized photobiomodulation as the first non-invasive treatment for dry AMD.

Same technology. Same wavelengths. Same mechanism AXRAH has been delivering to clinics since day one.

This is the moment medical directors were waiting for. The ones who already installed AXRAH are ahead of it.

Here's what the authorization means — and what it means for your clinic specifically. ↓
